...

Part 4: Lingua-A – Expressions  
(Sections 4.4 – 4.9 of the book)

Andrzej Jacek Blikle

March 18<sup>th</sup>, 2021

# Values and states

## Preliminaries

$\text{val} : \text{Value} = \{(\text{dat}, \text{typ}) \mid \text{dat} : \text{CLAN-Ty.typ}\}$

$\text{val} : \text{PsValue} = \{(\Omega, \text{typ}) \mid \text{typ} : \text{Type}\}$

A pseudo-data

$\text{val} = (\text{dat}, \text{typ}) = (\text{dat}, (\text{bod}, \text{yok})) = ((\text{dat}, \text{bod}), \text{yok}) = (\text{com}, \text{yok})$

type

com

$\text{sta} : \text{State} = \text{Env} \times \text{Store}$

$\text{env} : \text{Env} = \text{TypEnv} \times \text{ProEnv}$

environments

$\text{sto} : \text{Store} = \text{Valuation} \times (\text{Error} \mid \{\text{'OK'}\})$

$\text{vat} : \text{Valuation} = \text{Identifier} \Rightarrow (\text{Value} \mid \text{PsValue})$

$\text{tye} : \text{TypEnv} = \text{Identifier} \Rightarrow (\text{Type} \mid \text{Body})$

type environments

$\text{pre} : \text{ProEnv} = \text{Identifier} \Rightarrow \text{Procedure}$

procedure environments

Procedure names

Variable identifiers

Type constant identifiers

$\text{sta} = ((\text{tye}, \text{pre}), (\text{vat}, \text{err})) \quad \text{err} : \text{Error} \mid \{\text{'OK'}\}$

this structure is not accidental

# States

## Auxiliary functions

$\text{error} : \text{State} \mapsto \text{Error} \mid \{\text{'OK'}\}$   
 $\text{error}(\text{env}, (\text{vat}, \text{err})) = \text{err}$

error-selection operator for states

$\text{is-error} : \text{State} \mapsto \text{Boolean}$   
 $\text{is-error.sta} =$   
 $\text{error.sta} \neq \text{'OK'} \rightarrow \text{tt}$   
**true**  $\rightarrow \text{ff}$

error-detection predicate for states

$\text{is-error} : \text{Store} \mapsto \text{Boolean}$   
 $\text{is-error}(\text{vat}, \text{err}) =$   
 $\text{err} \neq \text{'OK'} \rightarrow \text{tt}$   
**true**  $\rightarrow \text{ff}$

error-detection predicate for stores

$\blacktriangleleft : \text{State} \times \text{Error} \mapsto \text{State}$   
 $(\text{env}, (\text{vat}, \text{err})) \blacktriangleleft \text{err-1} =$   
 $(\text{env}, (\text{vat}, \text{err-1}))$

error-insertion operator for states

# Carriers of the algebra of expression denotations

## Carriers of AlgExpDen:

ide : Identifier = ...

ded : DatExpDen = State  $\rightarrow$  ValueE

bed : BodExpDen = State  $\mapsto$  BodyE

tra : TraExpDen = Transfer

yok : YokExpDen = Yoke

ted : TypExpDen = State  $\mapsto$  TypeE

data-expression denotations

body-expression denotations

transfer-expression denotations

yoke-expression denotations

type-expression denotations

Here no functions on states since transfers and yokes are not storable; (an engineering decision).

# Data-expression denotations

$\text{ded} : \text{DatExpDen} = \text{State} \rightarrow \text{ValueE}$

Partial functions due to functional procedures!

Transparent denotations

$\text{ded}(\text{env}, (\text{vat}, \text{err})) = \text{err}$  whenever  $\text{err} \neq \text{'OK'}$ .

DEF A constructor of denotations is called **diligent** if it builds transparent denotations.

rzetelny

All constructors of expression denotations will be diligent.

All reachable expression denotations will be transparent.

Four groups of constructors of expression denotations

- 1) one constructor of variables,
- 2) constructors derived from (non-Boolean) value constructors (one for each),
- 3) Boolean constructors,
- 4) one constructor for conditional expressions.

# Data-expression denotations

Constructors derived from value constructors

A constructor of variables

ded-variable : Identifier  $\mapsto$  DatExpDen

A metaconstructor (creates constructors of data-expression denotations)

Cdd : Constructors of Values  $\mapsto$  Constructors of DatExpDen

Zero-argument constructors

Cdd.[va-create-id.ide] :  $\mapsto$  Identifier for ide : Identifier

Cdd.[va-create-bo.boo] :  $\mapsto$  DatExpDen for boo : Boolean

Cdd.[va-create-in.int] :  $\mapsto$  DatExpDen for int : IntegerS

Cdd.[va-create-wo.wor] :  $\mapsto$  DatExpDen for wor : WordS

Comparison constructors

Cdd.[ded-equal] : DatExpDen x DatExpDen  $\mapsto$  DatExpDen

Cdd.[ded-less] : DatExpDen x DatExpDen  $\mapsto$  DatExpDen

Arithmetic constructors

Cdd.[va-add-in] : DatExpDen x DatExpDen  $\mapsto$  DatExpDen

Cdd.[va-divide-in] : DatExpDen x DatExpDen  $\mapsto$  DatExpDen

etc. for integers and reals

Word constructors

Cdd.[va-glue] : DatExpDen x DatExpDen  $\mapsto$  DatExpDen

# Data-expression denotations

Constructors derived from value constructors

## List constructors

|                    |                         |                     |
|--------------------|-------------------------|---------------------|
| Cdd.[va-create-li] | : DatExpDen             | $\mapsto$ DatExpDen |
| Cdd.[va-push]      | : DatExpDen x DatExpDen | $\mapsto$ DatExpDen |
| Cdd.[va-top]       | : DatExpDen             | $\mapsto$ DatExpDen |
| Cdd.[va-pop]       | : DatExpDen             | $\mapsto$ DatExpDen |

## Array constructors

|                       |                                     |                     |
|-----------------------|-------------------------------------|---------------------|
| Cdd.[va-create-ar]    | : DatExpDen                         | $\mapsto$ DatExpDen |
| Cdd.[va-put-to-ar]    | : DatExpDen x DatExpDen             | $\mapsto$ DatExpDen |
| Cdd.[va-change-in-ar] | : DatExpDen x DatExpDen x DatExpDen | $\mapsto$ DatExpDen |
| Cdd.[va-get-from-ar]  | : DatExpDen x DatExpDen             | $\mapsto$ DatExpDen |

## Record constructors

|                       |                                      |                     |
|-----------------------|--------------------------------------|---------------------|
| Cdd.[va-create-re]    | : Identifier x DatExpDen             | $\mapsto$ DatExpDen |
| Cdd.[va-put-to-re]    | : DatExpDen x DatExpDen x Identifier | $\mapsto$ DatExpDen |
| Cdd.[va-get-from-re]  | : DatExpDen x Identifier             | $\mapsto$ DatExpDen |
| Cdd.[va-change-in-re] | : DatExpDen x Identifier x DatExpDen | $\mapsto$ DatExpDen |

# Data-expression denotations

## Constructors

### Boolean constructors

ded-and : DatExpDen x DatExpDen  $\mapsto$  DatExpDen

ded-or : DatExpDen x DatExpDen  $\mapsto$  DatExpDen

ded-not : DatExpDen  $\mapsto$  DatExpDen

### Conditional-expression constructor

when : DatExpDen x DatExpDen x DatExpDen  $\mapsto$  DatExpDen

# Data-expression denotations

## Data-variable constructor

dat-variable : Identifier  $\mapsto$  DatExpDen

dat-variable.ide.sta =

is-error.sta  $\rightarrow$  error.sta

**let**

(env, (vat, 'OK')) = sta

vat.ide = ?  $\rightarrow$  'undeclared-variable'

**let**

(dat, typ) = vat.ide

dat =  $\Omega$   $\rightarrow$  'uninitialized-variable'

**true**  $\rightarrow$  (dat, typ)

diligence of  
dat-variable

rzetelność

We eliminate a possible pseudo values from further computations which means that they are never “sent” to a composite constructor as an arguments.

# Data-expression denotations

Constructors derived from composite-constructors

$vco$  :  $ValIde-1$   $x \dots x$   $ValIde-n$   $\mapsto$   $ValueE$   
 $Cdd[vco]$  :  $DatExpDenIde-1$   $x \dots x$   $DatExpDenIde-n$   $\mapsto$   $DatExpDen$   
 $Cdd$  – metaconstructor of constructors of data-expression denotations

$Cdd[vco].(arg-1, \dots, arg-n).sta =$   $n \geq 0$   
 $is-error.sta \rightarrow error.sta$   
**for**  $i = 1; n$   
**do**  
   $(arg-i \text{ !: Identifier})$  **and**  $arg-i.sta = ? \rightarrow ?$   
  **let**  
     $val-i =$   
     $arg-i : Identifier \rightarrow arg-i$   
    **true**  $\rightarrow arg-i.sta$   
**od**  
**true**  $\rightarrow vco.(val-1, \dots, val-n)$

diligence of  
 $Cdd[cva]$

Performs further error-analysis

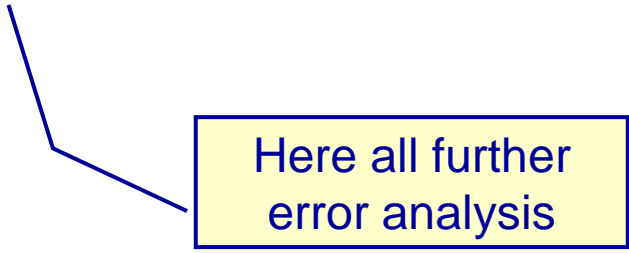

This scheme is not applicable to boolean constructors, since they are not transparent.

# Data-expression denotations

An example of a derived constructor

$va\text{-}divide\text{-}in : ValueE \times ValueE \mapsto ValueE$   
 $Cdd[va\text{-}divide\text{-}re] : DatExpDen \times DatExpDen \mapsto DatExpDen$

$Cdd[va\text{-}divide\text{-}re].[ded\text{-}1, ded\text{-}2].sta =$   
is-error.sta  $\rightarrow$  error.sta  
ded-i.sta = ?  $\rightarrow$  ? for i = 1,2  
**let**  
val-i = ded-i.sta for i = 1,2  
**true**  $\rightarrow va\text{-}divide\text{-}re.(val\text{-}1, val\text{-}2)$

Here all further  
error analysis

# Data-expression denotations

## Boolean constructors (McCarthy's laziness)

$\text{ded-and} : \text{DatExpDen} \times \text{DatExpDen} \mapsto \text{DatExpDen}$

$\text{ded-and}.\text{(ded-1, ded-2).sta} =$

$\text{is-error.sta} \quad \rightarrow \text{error.sta}$

$\text{ded-1.sta} = ? \quad \rightarrow ?$

**let**

$\text{val-1} = \text{ded-1.sta}$

$\text{val-1} : \text{Error} \quad \rightarrow \text{val-1}$

**let**

$\text{(dat-1, bod-1, yok-1)} = \text{val-1}$

$\text{dat-1} = \text{ff} \quad \rightarrow \text{ff}$

$\text{bod-1} \neq \text{'Boolean'} \quad \rightarrow \text{'Boolean-expected'}$

$\text{ded-2.sta} = ? \quad \rightarrow ?$

**let**

$\text{val-2} = \text{ded-2.sta}$

$\text{val-2} : \text{Error} \quad \rightarrow \text{val-2}$

**let**

$\text{(dat-2, bod-2, yok-2)} = \text{val-2}$

$\text{bod-2} \neq \text{'Boolean'} \quad \rightarrow \text{'Boolean-expected'}$

**true**  $\quad \rightarrow \text{(dat-2, ('Boolean'), TT)}$

ded-or and ded-not are defined in an analogous way

Here we possibly avoid an infinite evaluation or an error from ded-2

# Data-expression denotations

## A conditional expression

when : DatExpDen x DatExpDen x DatExpDen  $\mapsto$  DatExpDen

when.(ded-1, ded-2, ded-3).sta =

is-error.sta  $\rightarrow$  error.sta

ded-1.sta = ?  $\rightarrow$  ?

**let**

val-1 = ded-1.sta

val-1 : Error  $\rightarrow$  val-1

**let**

(dat-1, bod-1, yok-1) = val-1

bod-1  $\neq$  ('Boolean')  $\rightarrow$  'Boolean-expected'

dat-1 = tt  $\rightarrow$  ded-2.sta

dat-1 = ff  $\rightarrow$  ded-3.sta

Lazy evaluation

The type of the result is not fixed!

Future syntax:

**if** x > 0 **then** x+2 **else** 'abcd' **fi**

**if** x > 0 **then** sqrt(x) **else** sqrt(-x) **fi**

Transparency would cause a problem for all x  $\neq$  0.

# Body-expression denotations

## Constructors

$\text{bod-constant} : \text{Identifier} \mapsto \text{BodExpDen}$

$\text{bod-constant.ide.sta} =$

$\text{is-error.sta} \rightarrow \text{error.sta}$

**let**

$((\text{tye}, \text{pre}), \text{sto}) = \text{sta}$

$\text{tye.ide} = ? \rightarrow \text{'body-constant-undefined'}$

**not**  $\text{tye.ide} : \text{Body} \rightarrow \text{'body-expected'}$

**true**  $\rightarrow \text{tye.ide}$

Body constants retrieve bodies from type environments.

Body, once assigned to a body constant is never changed.

## Metaconstructor of constructors of body-expression denotations

$\text{Cbd} : \text{Constructors of bodies} \mapsto \text{Constructors of body-expression denotations}$

## Constructors derived from body constructors

$\text{Cbd}.\text{[bo-create-bo]} : \mapsto \text{BodExpDen}$

$\text{Cbd}.\text{[bo-create-nu]} : \mapsto \text{BodExpDen}$

$\text{Cbd}.\text{[bo-create-wo]} : \mapsto \text{BodExpDen}$

$\text{Cbd}.\text{[bo-create-ar]} : \text{BodExpDen} \mapsto \text{BodExpDen}$

$\text{Cbd}.\text{[bo-create-re]} : \text{BodExpDen} \times \text{Identifier} \mapsto \text{BodExpDen}$

$\text{Cbd}.\text{[bo-put-to-re]} : \text{BodExpDen} \times \text{Identifier} \times \text{BodExpDen} \mapsto \text{BodExpDen}$

# Body-expression denotations

Constructors derived from body constructors

$bco$  :  $BodIde-1 \times \dots \times BodIde-n$   $\mapsto$   $BodyE$

$Cbd.[bco]$  :  $BodExpDenIde-1 \times \dots \times BodExpDenIde-n$   $\mapsto$   $BodExpDen$

$Cbd$  – metaconstructor of body-expression denotations

$Cbd.[bco].(arg-1, \dots, arg-n).sta =$

$is-error.sta \rightarrow error.sta$

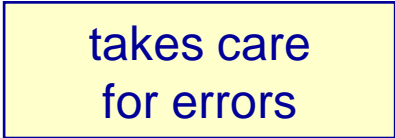

**let**

$bod-i =$  **for**  $i = 1;n$

$arg-i : Identifier \rightarrow arg-i$

**true**  $\rightarrow arg-i.sta$

**true**  $\rightarrow bco.(bod-1, \dots, bod-n)$

takes care  
for errors

# Body-expression denotations

Two examples of derived constructors

$\text{Cbd.}[\text{bo-create-in}] : \mapsto \text{BodExpDen}$

$\text{Cbd.}[\text{bo-create-in}].().\text{sta} =$   
is-error.sta  $\rightarrow$  error.sta  
**true**  $\rightarrow$  **bo-create-in.()**

$\text{Cbd.}[\text{bo-put-to-re}] : \text{BodExpDen} \times \text{Identifier} \times \text{BodExpDen} \mapsto \text{BodExpDen}$

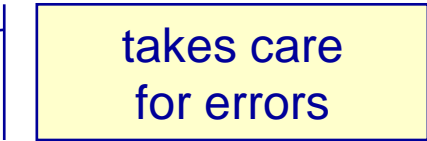

$\text{Cbd.}[\text{bo-put-to-re}].(\text{bed-e}, \text{ide}, \text{bed-r}).\text{sta} =$  e for “element”, r for “record”

is-error.sta  $\rightarrow$  error.sta

**let**

bod-i = bed-i.sta                      for i = e, r

**true**  $\rightarrow$  **bo-put-to-re.()**(bod-e, ide, bod-r)

takes care  
for errors

# Type-expression denotations

Two constructors only

$\text{typ-constant} : \text{Identifier} \mapsto \text{TypExpDen}$

$\text{typ-constant.ide.sta} =$

$\text{is-error.sta} \rightarrow \text{error.sta}$

**let**

$((\text{tye}, \text{pre}), \text{sto}) = \text{sta}$

$\text{tye.ide} = ? \rightarrow \text{'type-constant-undefined'}$

$\text{tye.ide} : \text{Body} \rightarrow \text{'type-expected'}$

**true**  $\rightarrow \text{tye.ide}$

$\text{create-ty} : \text{BodExpDen} \times \text{YokExpDen} \mapsto \text{TypExpDen}$

$\text{create-ty}(\text{bed}, \text{yok}).\text{sta} =$

$\text{is-error.sta} \rightarrow \text{error.sta}$

**let**

$\text{bod} = \text{bed.sta}$

$\text{bod} : \text{Error} \rightarrow \text{bod}$

**true**  $\rightarrow (\text{bod}, \text{yok})$

The mechanisms of creating values, and assigning them to variables, will raise error messages in cases of empty types.

A type expression may be either an identifier or a type-creating expression.

# Abstract syntax of Lingua-A

# Colloquial syntax of Lingua-A

## examples of rules

| instead of  | we write  |
|---|---|
| $(x + (y + z))$   | $x + y + z$ : left association                    |
| $(x + (y * z))$   | $x + y * z$ : priority of * over +                |
| <pre> <b>put-to-arr</b>   <b>put-to-arr</b>     <b>array</b> x <b>ee</b>   <b>new</b> x+y <b>ee</b> <b>new</b> 3*y <b>ee</b>           </pre> | <pre> <b>array</b> [x, x+y, 3*y]           </pre> |

Syntactic sugar: spaces, tabulators, carriage returns, boldface and underlining do not affect denotations of syntax.

# Semantics of Lingua-A

$Cs : \underline{AlgExp} \mapsto \underline{AlgExpDen}$

A homomorphism with six components:

$Sid : Identifier \mapsto Identifier$

— identity mapping

$Sde : DatExp \mapsto DatExpDen$

$Sbe : BodExp \mapsto BodExpDen$

$Stre : TraExp \mapsto TraExpDen$

$Syoe : YokExp \mapsto YokExpDen$

$Ste : TypExp \mapsto TypExpDen$

## Examples

$Sde : DatExp \mapsto DatExpDen$  i.e.

$Sde : DatExp \mapsto State \rightarrow ValueE$

$Sde.[true] = Cdd[co-create-bo.tt].()$

— algebraic form

$Sde.[true].sta =$

— direct form

$is-error.sta \rightarrow error.sta$

$true \rightarrow (tt, ('Boolean'), TT)$

# Semantics of Lingua-A

## Implementor's perspective

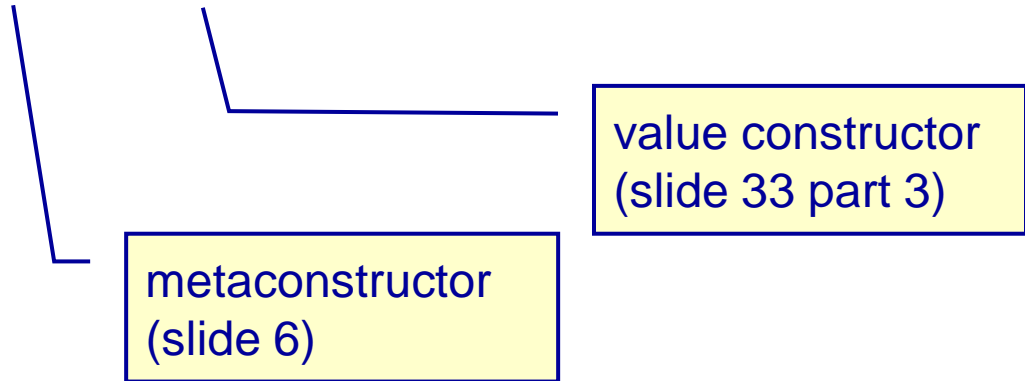

$Sde : \text{DatExp} \mapsto \text{DatExpDen}$       i.e.

$Sde : \text{DatExp} \mapsto \text{State} \rightarrow \text{ValueE}$

### Algebraic form

$Sde.[(dae-1 / dae-2)] =$

$Cdd[va-divide-re].(Sde.[dae-1], Sde.[dae-2])$

# Semantics of Lingua-A

## User's perspective

Sde : DatExp  $\mapsto$  DatExpDen      i.e.  
Sde : DatExp  $\mapsto$  State  $\rightarrow$  ValueE

Direct form – user oriented (cf. part 3 slide 28)

```
Sde.[(dae-1 / dae-2)].sta =  
  is-error.sta             $\rightarrow$  error.sta  
  Sde.[dae-i].sta = ?  $\rightarrow$  ?            for i = 1, 2  
let  
  val-i = Sde.[dae-i].sta            for i = 1, 2  
  val-i : Error             $\rightarrow$  val-i            for i = 1, 2  
let  
  (dat-i, bod-i, yok-i) = Sde.[dae-i].sta            for i = 1, 2  
  bod-i  $\neq$  ('real')             $\rightarrow$  'real-expected'            for i = 1, 2  
let  
  rea = divide-re.(dat-1, dat-2)  
  rea : Error             $\rightarrow$  rea  
true             $\rightarrow$  (rea, ('real'), TT)
```

primitive operation

# A manual of a programming language based on denotational semantics

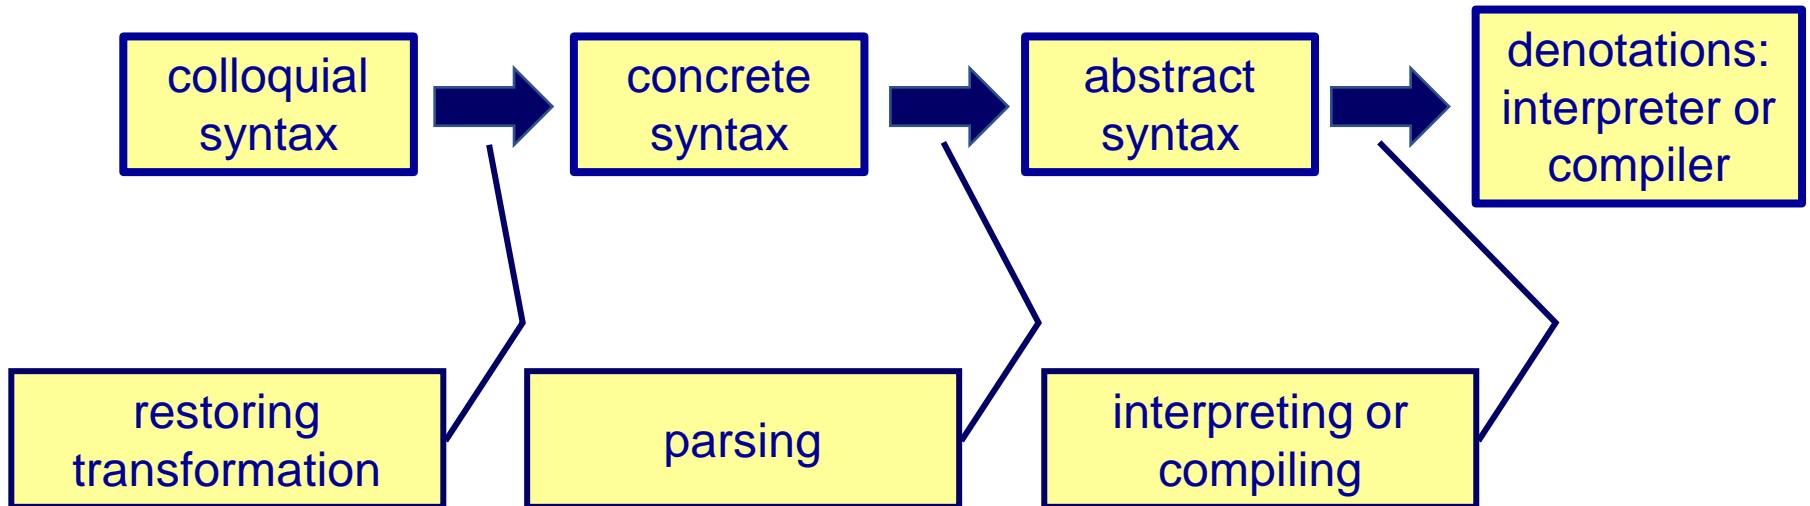

## Three parts of a manual

1. concrete syntax described by equational grammar and illustrated by examples,
2. colloquial syntax illustrated by examples of restoring transformations (e.g. as in Sec. 4.4.3),
3. the semantics of concrete syntax, i.e. the association of concrete programs to their denotations without referring to abstract syntax.

## Two forms of a manual

- A. definitions that refer to (“call”) denotation-algebra constructors defined earlier such definitions will be called algebraic (for implementors)
- B. definitions that describe constructors explicitly, such definitions will be called direct. (for users)

# Major milestones on a way to program execution

Thank you for  
your attention
